langsci-affiliations

Felix Kopecky*

Version 1.0.1 - 24th February 2021

1 User guide

This package provides a command \ResolveAffiliations, which collects authoraffiliation pairs and outputs them according to the user configuration. It is aimed at class authors, i.e. maintainers of document templates in publishing houses, universities, etc. It is probably not that useful to document authors.

\ResolveAffiliations

 $\verb|\ResolveAffiliations|| \{\langle pairs \ of \ authors \ and \ affiliations \rangle\}|$

Takes the $\{\langle pairs\ of\ authors\ and\ affiliations\rangle\}$, orders them internally and outputs them according to the $[\langle options\rangle]$.

 $\{\langle Pairs\ of\ authors\ and\ affiliations\rangle\}$ is a list of authors and affiliations, where authors are separated by and and affiliations by ;. Affiliations are given within a phantom command \affiliation within the $\{\langle pairs\rangle\}$ argument – i.e. the command is not defined by this package and possibly existing definitions are left unchanged.

For example:

```
\ResolveAffiliations{
   A. U. Thor\affiliation{University of the Moon; University of Mars}
   and B. U. Thor\affiliation{University of Mars}
}
results in:
```

A. U. Thor^{a,b} & B. U. Thor^b

^aUniversity of the Moon ^bUniversity of Mars

The output can be customised using the $[\langle options \rangle]$. They are described below.

 $[\]begin{tabular}{ll} *mailto:felix.kopecky@langsci-press.org. & Please submit bug reports and feature requests to https://github.com/langsci/langsci-affiliations/issues. & Please submit bug reports and feature requests to https://github.com/langsci/langsci-affiliations/issues. & Please submit bug reports and feature requests to https://github.com/langsci/langsci-affiliations/issues. & Please submit bug reports and feature requests to https://github.com/langsci/langsci-affiliations/issues. & Please submit bug reports and feature requests to https://github.com/langsci/langsci-affiliations/issues. & Please submit bug reports and feature requests to https://github.com/langsci/langsci-affiliations/issues. & Please submit bug reports and feature requests to https://github.com/langsci/langsci-affiliations/issues. & Please submit bug reports and feature requests to https://github.com/langsci/langsci-affiliations/issues. & Please submit bug reports and feature requests are requested for the property of the please submit bug reports are requested for the please submit bug report$

\SetupAffiliations

 \P

Options can be set either globally or locally. With $\texttt{SetupAffiliations}\{\langle options \rangle\}$, they apply globally. If they are set with $\texttt{ResolveAffiliations}[\langle options \rangle]$, they apply locally.

mark style = $\langle style \rangle$

(initially alphabetic)

Controls which markers should be used in the indexes of affiliations. Can be a either of {alphabetic, numeric, circled, none}.

output affiliation = $\langle boolean \rangle$

(initially true)

Affiliations are output if true, otherwise not.

output in groups = $\langle boolean \rangle$

(initially true)

If true, authors and affiliations are output in the same line. When false each author and affiliation gets its own line.

output authors font = $\langle font \ commands \rangle$

(initially \Large)

Stores the font settings for the ouput of authors.

output affiliation font = $\langle font \ commands \rangle$

(initially \normalsize)

Stores the font settings for outputting affiliations.

Output separators between authors and affiliations are customisable as well:

separator between two = $\langle tokens \rangle$

(initially ~&~)

If there are only two authors, use these $\langle tokens \rangle$ to separate them.

separator between multiple = $\langle tokens \rangle$

(initially ,~)

If there are more than two authors, use these $\langle tokens \rangle$ to separate every pair except the last one.

separator between final two = $\langle tokens \rangle$

(initially ~&~)

Use these $\langle tokens \rangle$ to separate the last pair of authors if ther are more than two.

separator between affiliations = $\langle tokens \rangle$

(initially,)

Use these to separate affiliations after each authors. The affiliations in the affiliation line are always separated by a space ().

The way the input is digested can be customised with these two settings:

input names separator = $\langle tokens \rangle$

(initially ~and~)

Separates the author names in the input.

input affiliation separator = $\langle tokens \rangle$

(intially;)

Separates the affiliations in the input, within dummy command \affiliation.

2 Implementation

```
1 (*package)
                         2 (00=affiliations)
                         3 \RequirePackage{xparse}
                         4 \ProvidesExplPackage {langsci-affiliations}
